REGISTERING (MAIL DOESN'T EXIST IN THE DATABASE)

	Mail	Password	is_verified	Mail is sent to	SocialAccount	-->	is_verified	SocialAccount
Classical non-google mail NGM and password P	NGM	P	False	NGM	Null	**V E R I F Y**	True	Null
Classical with-google mail GM and password P	GM	P	False	GM	Null		True	Null
Google with non-verified mail NVM	NVM	Random string	False	NVM	Google		True	Google
Google with verified mail VM	VM	Random string	True	NO MAIL SENT (NO VERIFICATION)	Google		True	Google

LOGGING IN (MAIL EXIST IN THE DATABASE)

BEFORE LOGIN			LOGIN TYPE	AFTER LOGIN		
Mail	**is_verified**	**SocialAccount**		**Password**	**is_verified**	**SocialAccount**
NGM	False	Null	Classical (NGM + P)	STAYS SAME	False	Null
NGM	True	Null	Classical (NGM + P)	STAYS SAME	True	Null
GM	False	Null	Classical (GM + P)	STAYS SAME	False	Null
GM	True	Null	Classical (GM + P)	STAYS SAME	True	Null
NVM	False	Google	Classical (NVM + P)	STAYS SAME	False	Google
NVM	True	Google	Classical (NVM + P)	STAYS SAME	True	Google
VM	True	Google	Classical (VM + P)	STAYS SAME	True	Google
NGM cant do Google login. At this point NGMs are turned into a GM (user created google account using NGM address) and mail type became either NVM or VM. So we can have profiles using NVM/VM mails with is_verified false and SocialAccount null.						
NVM	False	Null	Google Login (with NVM)	Reset to random string*	False	Google
NVM	False	Google	Google Login (with NVM)	Reset to random string*	False	Google
VM	False	Null	Google Login (with VM)	Reset to random string*	True	Google
VM	False	Google	Google Login (with VM)	Reset to random string*	True	Google
NVM	True	Null	Google Login (with NVM)	STAYS SAME**	True	Google
NVM	True	Google	Google Login (with NVM)	STAYS SAME**	True	Google
VM	True	Null	Google Login (with VM)	STAYS SAME**	True	Google
VM	True	Google	Google Login (with VM)	STAYS SAME**	True	Google

*Real owner of the profile.mail is loggin in for the first time with google. This is the scenario where user wants to overtake the profile with his own mail from an imitation attack. Send a mail in this case saying "We reset your profile password because this can be a 'Profile save from imitation" scenario.
**We dont care the difference between NVM and VM as long as user verifies the mail with us. We care that the profile.owner is the real owner of the mail (having the password to the mail). So is_verified=True can overwrite the google_login_main.is_verified

CHANGING THE MAIL OF AN EXISTING PROFILE

When you change a profile's mail in the edit profile page, website no longer knows if the mail is an NGM, GM, NVM, or VM (meaning SocialAccount is now null). And we don't know if you are the new mail's owner aswell (meaning is_verified is false).

So any mail change results in a 'refreshed account' but we DONT reset the password to not lock you out of your account in case you plan on using the new mail with classical login (We strongly suggest that you use a mail you own the google account of. It's secure either way as long as your new mail is secure, meaning people dont know the password to check your mails).

SOME SECURITY STUFF YOU MAY WANT TO HEAR:

1- Dont share your passwords (both to your MaGNaM account and to your mail)
2- Try to not use mails that are under surveillance. For example a university or a company mail which's content can be seen by IT admins. (I don't know if IT admins have that privilage but you got the point. You should be the only one who has access to the mail you write as your MaGNaM mail)
3- We dont think badly of people who has multiple alt accounts, just verify them or they'll get deleted.

4- We also dont care if you want to share your account with friends. But dont expect us to solve the problems between you and your friends. We'll listen to the complaints and see if we can do something about it but responsibility to managa shared accounts are on you.
